# Frontend Dev Task

## Introduction

A lot of the work we do involves using statistical data from sources such as OPTA (football) and Racing Post (horse racing) and displaying that data in useful ways for the user.

As an introductory task we would like you to pull data from an API and build a little football data widget as can be seen in full on this page:

https://footyaccumulators.com/predictions/germany-vs-france-27-07-2022

There's a lot involved in the full version of the widget on there so we would like you to look at this **General section only**:

# Styling

Basic styling is fine, don't worry about spending ages getting it to look exactly like the above. We'd rather you concentrate on the functionality in the time you have available to work on it.

# Data

The API to retrieve the data for the match is:

https://odds-api.dev.checkd-dev.com/dev/smartacca/fixtures/7guiizddobmjb28yptfeghcoa/preview

The key areas in there are:

1. The team details are in **match.contestant**
2. The competition details are in **match.meta**
3. The scores are in **match.liveData.matchDetails.scores**
4. The stats are in **match.liveData.lineups.home.stats** & **match.liveData.lineups.away.stats** where fh = first half and sh = second half.
